Research Statement

I am a developmental cognitive neuroscientist investigating optimal attention and learning strategies across the lifespan. My EEG and behavioral research from infancy to aging adulthood investigates how learner factors (e.g., prior knowledge, learning approach) and environmental factors (e.g., scaffolding) facilitate the selection of relevant information to promote new learning in some contexts, while being detrimental to new learning in other contexts. This research reconceptualizes healthy cognitive aging as an outcome of learning strategies and habits developed throughout the lifespan, rather than an inevitable stage of development. The goal of this research is to use infant and child research to promote cognitive development across the lifespan.
